

Battery cell connections

The cell is one electrochemical unit inside the battery pack. Measure the cell voltage before charging.

The terminal is the cell's electrical connector. Inspect the terminal before connecting the lead.

The lead is the insulated cable attached to the terminal. This lead contains no exposed conductor.

The charge is electric charge stored in the cell, not a fee. Record the charge transferred during the 10 second test.

Keep the voltage below 4.2 V and the current below 15 A. Stop charging if the battery temperature rises.

Service the motor every 100 km. Keep MODEL-X and <https://example.com/manual> in the inspection record.
